- Lower than the VMR (Maximum Value Recommended).
- Higher than VMR and below the VMA (Maximum Permitted Value).
- Higher than VMR. For this parameter is not defined one VMA.
- Higher than the VMA.

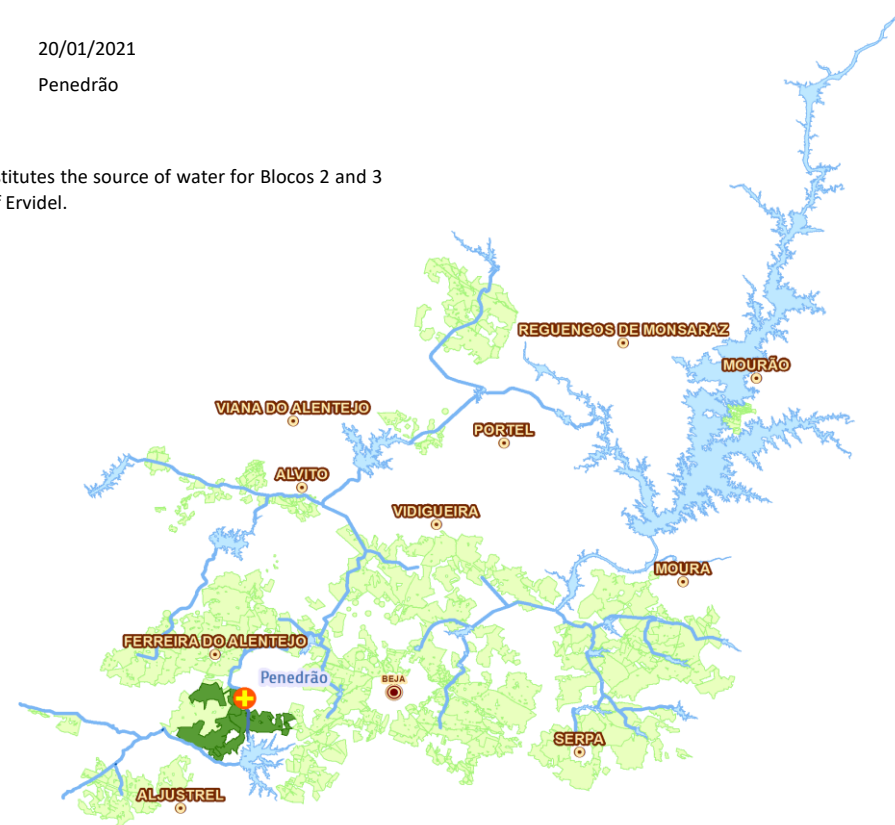

(a) The maximum value recommended in the Integrated Production Standards, for most crops, is 90 mg / L.

Sampling Data: 20/01/2021

Sampling Place: Penedrão

Benefited areas:

The Penedrão reservoir constitutes the source of water for Blocos 2 and 3 of the irrigation perimeter of Ervidel.

Comments:

The bicarbonate values exceed the maximum value recommended in the Integrated Production Standards. High concentrations of bicarbonates can affect crop yields, making it difficult to absorb some mineral nutrients.

The results of the remaining elements are within the range of expected values for this typology of water bodies.

In the document "Water Quality - Complementary Information", EDIA recommends some general measures to reduce the concentration of salts in the water bodies.
